

Study Log prototype testing

Date: _____ Initials: _____

As part of a class project, I am developing an electronic log for assisting students in Greek organizations with tracking their study time. This system will be presented using a touch-screen monitor and a card reader for student IDs. I will act as the computer, presenting you with paper versions of the screens end-users will see and touch. Please help us by using this system as if you were an end user. If you have any observations or suggestions for improvement, feel free to offer them at any time. Do you have any questions before we begin?

1. Assume you are a member of a fictitious co-ed fraternity, Tau Epsilon Sigma Tau, and have a student ID number of 123. This is your first time using the system. You do not have your ID with you, and will log-in using the screen's number pad to set up your log. Please log in now, and follow the prompts.
2. When you reach the confirmation screen, indicate the information is correct. Then indicate you will begin studying now.
3. It is two hours later, and you have finished studying. Use the system to check your totals, and end the study session.
4. Do you have any criticisms of the system, or suggestions for improvement?

Thank you for your time.
